

LATVIAN ENTIMINAE (COLEOPTERA: CURCULIONIDAE): 4. TRIBE PHYLLOBIINI SCHÖNHERR, 1826

Maksims Balalaikins

Balalaikins M. 2012. Latvian Entiminae (Coleoptera: Curculionidae): 4. Tribe Phyllobiini Schönherr, 1826. *Acta Biol. Univ. Daugavp.*, 12 (1): 24 – 38.

Faunal, phenological and bibliographical information on Latvian Phyllobiini are presented in the current paper. One species, *Phyllobius jacobsoni* Smirnov, 1913 is reported for the first time for the Latvian fauna. Bibliographical analysis on this weevil tribe in Latvia is made. The annotated list of Latvian Phyllobiini including 13 species is given.

Key words: Coleoptera, Curculionidae, Phyllobiini, Latvia, fauna, bibliography.

Maksims Balalaikins, Institute of Systematic Biology, Daugavpils University, Vienības 13, Daugavpils, LV-5401, Latvia; maksims.balalaikins@biology.lv

INTRODUCTION

The tribe Phyllobiini Schönherr includes 33 genera distributed worldwide (Alonso-Zarazaga & Lyal 1999). In Fennoscandia and the Baltic States fauna of this tribe represented by two genera *Pseudomyllocerus* Derbrouchers des Loges, 1872 (reported only for Lithuania) and *Phyllobius* Germar, 1824 (Silfverberg 2010). The genus *Phyllobius* is of Palaearctic origin and there are about 130 species of this genus known in the Palaearctic region more than 80 of them are known from the Western Palearctic region (Pesarini 1981). 15 species of this genus occur in Fennoscandia and the Baltic States (Silfverberg 2010).

Hitherto, in Latvian fauna, 1 genus and 11 species of Phyllobiini are reported (Telnov 2004, Silfverberg 2010). In adjacent territories, the number of registered Phyllobiini species varies slightly: 13 species are recorded from Belarus (Alexandrovich et al. 1996), 11 species in Estonia – (Silfverberg 2010) and 15 species in Lithuania (Tamutis et al. 2011).

The first data on representatives of Phyllobiini in Latvia were published at the end of the 18th century in a monograph on natural history of Livland (Fischer 1784, 1791) and about 20 works appeared subsequently. Faunal data on this tribe can also be found in the following works: Barševskis 1993, 1997, 2001, Brammanis 1930, Groschke 1805, Kalnīņš et al. 2007, Leiskina 1999, Lindberg 1932, Petrova et al. 2000, 2006, Priedītis 1958, 1979, Spuņģis 2008, Ulanowski 1884, Varzinska and Milander 1979, Varzinska & Milander 1981.

Imago of *Phyllobius* feed on foliage of herbaceous plants (mostly on *Achillea*, *Artemisia*, *Filipendula*, *Urtica*, and other), and deciduous trees and shrubs (mostly on *Betula*, *Prunus*, *Rubus*, *Salix*, *Sorbus*, *Quercus* and other) rarely on coniferous trees. Some species of the genus *Phyllobius* are pests of cultivated plants (Kryzhanovskij 1974). In Latvia *Ph. vespertinus* and *Ph. pomaceus* are reported as the pests of cultivated plants (Ozols 1973).

The aim of the current work is to summarize information available on Phyllobiini in Latvia.

Faunal data on 12 species are presented. Complete annotated bibliographical information on this weevil tribe in Latvia is compiled. The annotated list of Latvian species of Phyllobiini is presented. Altogether, 12 species are reported for Latvia.

MATERIAL AND METHODS

A total of ~1400 specimens were reviewed during the current study. The examined material is deposited in the collection of the Institute of Systematic Biology of Daugavpils University (DUBC, Daugavpils, Latvia), the entomological collection of the Institute of Biology of the Latvian University (LUBI, Salaspils, Latvia), the collection of the Latvian Natural History Museum (LDM, Rīga, Latvia), the collection of A. Barševskis (Daugavpils University, Daugavpils, Latvia), the collection of C. Müthel (Latvian Natural History Museum, Rīga, Latvia).

The following keys were used for species identification: (Smreczynski 1966, Dieckmann 1980, Kippenberg 1981, Palm 1996, Morris 1997, Yunakov 2003). In this article, we follow the systematics suggested by Palm (1997) and Yunakov (2003), the nomenclature and synonymy used are in compliance with Alonso-Zarazaga and Lyal (1999, 2002) and Tamutis *et al.* (2011). Species are arranged alphabetically, subgenera according to Yunakov (2003). The general distribution of species and host plants is presented in the following works: Bajtenov 1974, Dedyukhin 2012, Dieckmann 1980, Hoffmann 1950, Kippenberg 1981, Legalov 2010, Legalov *et al.* 2010, Smreczynski 1966. The classification of chorotypes follows the one suggested by Vigna-Taglianti *et al.* (1999) and Gorodkov (1984). The chorotype codes used stand for: EUR – European, EWS – European-West Siberian, SIE - Siberian-European; ASE – Asiatic-European, TUE – Turano European; WPA – West-Palaearctic.

The following information is given for each species: scientific name & author, available bibliographical sources for Latvia, approved faunal data (number of collected or observed

specimens is mentioned in parentheses), host plants, phenology (Latvian data only; IV, VI, VII, VIII, IX, – months from March to September respectively), general distribution of species inclusive the chorotype code.

All records of examined material are arranged by the system of administrative districts, used in Latvia from 1991 to 2008.

The following abbreviations are used: C – central, d. – district, E – East, env. – environs, Isl. – island, N – North, NP – National Park, NPT – Nature protected territory, S – South, W – West. Some of the abbreviations employed are not standard English language abbreviations.

RESULTS AND DISCUSSION

During the current research, occurrence of 10 species and 5 subgenera of *Phyllobius* were confirmed for Latvia. One species, *Phyllobius jacobsoni* Smirnov, 1913 is reported for the first time for the Latvian fauna. Overall, the list of Latvian Phyllobiini includes 5 subgenera and 12 species.

Notes on species occurrence frequency in Latvia were prepared after studying the material and analysing the bibliographical data on Phyllobiini. Three species (*Phyllobius arborator* (Herbst, 1797), *Ph. maculicornis* Germar 1824 and *Ph. pomaceus* Gyllenhal, 1834) are considered very common (known more than 40 localities), five species (*Phyllobius oblongus* (Linnaeus, 1758), *Ph. virideaeris* (Laicharting, 1781), *Ph. glaucus* (Scopoli, 1763), *Ph. argentatus* (Linnaeus, 1758) and *Ph. pyri* (Linnaeus, 1758)) are considered common (known from 20 to 40 localities), two species (*Phyllobius viridicollis* (Fabricius, 1792) and *Ph. vespertinus* (Fabricius, 1792)) are infrequent (known from 10 to 19 localities) and one species (*Phyllobius jacobsoni* Smirnov, 1913) is very rare (known from 1 to 5 localities). Occurrence of one species (*Phyllobius betulinus* (Bech. & Scharfenberg, 1805)) in Latvia is doubtful.

Performed analysis of chorotypes of Latvian

Phyllobiini reveals that the range of chorotypes is rather wide: Turano European – one species (*Phyllobius jacobsoni*), European – four species (*Phyllobius arborator*, *Ph. argentatus*, *Ph. Betulinus*, *Ph. vespertinus*), European-West Siberian – one species (*Phyllobius viridicollis*), Siberian-European – three species (*Phyllobius maculicornis*, *Ph. oblongus*, *Ph. virideaeris*), Asiatic-European – two species (*Phyllobius pomaceus* and *Ph. pyri*) and West-Palaearctic one species (*Phyllobius glaucus*).

Annotated Check-List of Curculionini of Latvian fauna

Family Curculionidae Latreille, 1802

Subfamily Entiminae Schönherr, 1826

Tribe Phyllobiini Schönherr, 1826

Genus *Phyllobius* Germar, 1824

Subgenus *Nemoicus* Dillwyn 1829

Ph. (Nemoicus) oblongus (Linnaeus, 1758)

Phenology: IV(1)-VII.

General distribution: Europe to Urals, Turkey, N Africa. [WPA].

Note: A common species in Latvia.

Ph. (Metaphyllobius) jacobsoni Smirnov, 1913

Examined material: 8 specimens: Daugavpils d.: Daugavpils, Jaunforštate, 2.06.2009 (1, leg. A. Bukejs), Daugavpils, Ruģeli 06.2006. (1, leg. V. Kokina), Ilgas, Silene NPT, 29.04. – 10.07.2000 (1, leg. L. Nikitina); Jēkabpils d.: Dunava, 1.06.2002 (2, leg. A. Barševskis), 3.06.2007 (2, leg. A. Barševskis); Rīga d.: Saulkrasti 28.06.1969 (1 ex. Dunes, forest).

Host plants: Polyphagous.

Phenology: VI.

General distribution: Europe, W Kazakhstan [TUE].

Note: A new species for the Latvian fauna. This species was mistakenly reduced to a synonym of *Phyllobius maculatus* Tournier, 1880 in Yunakov and Korotyaev (2007) (N.N. Yunakov pers. comm.). *Ph. jacobsoni* also is known in Lithuania and Poland as *Ph. fessus* Boheman, 1843 (Wanat 2005) (N.N. Yunakov pers. comm.).

Ph. (Metaphyllobius) pomaceus Gyllenhal, 1834
= *urticae* (De Geer, 1775 nec Scopoli, 1763)

Host plants: Polyphagous: *Alnus*, *Betula* (Betulaceae); *Corylus* (Corylaceae); *Fagus*, *Quercus* (Fagaceae); *Picea*, *Pinus* (Pinaceae); *Cerasus*, *Fragaria*, *Malus*, *Rosa*, *Rubus*, *Sorbus* (Rosaceae); *Populus*, *Salix* (Salicaceae); *Tilia* (Tiliaceae); *Ulmus* (Ulmaceae).

Phenology: VI-VIII.

General distribution: Europe. [EUR].

Note: A very common species in Latvia.

Ph. (s. str.) betulinus (Bechstein & Scharfenberg, 1805)

=*betulae* (Fabricius, 1801) nec Linnaeus, 1758)

References: Rathlef 1905; Brammanis 1930; Barševskis 1997 (misidentification), 2002; Telnov 2004.

Host plants: Polyphagous: *Crataegus*, *Prunus*, *Rosa* (Rosaceae).

Localities: Rīga d.: Inčukalns.

Phenology: VII.

General distribution: Central and South Europe [EUR].

Note: The previous report of this species from Daugavpils district: Silene NP (Barševskis 1997) was based on misidentification. Occurrence of this species in Latvia is doubtful.

Ph. (s. str.) pyri (Linnaeus, 1758)

Telnov), Kūdra, 6.06.1997 (1, leg. A. Titovs).

Host plants: Polyphagous: *Betula* (Betulaceae), *Achillea*, *Artemisia*, *Tussilago* (Compositae), *Lathyrus* (Fabaceae), *Dactylis* (Gramineae), *Crataegus*, *Fragaria*, *Potentilla*, *Prunus*

(Rosaceae), *Galium* (Rubiaceae), *Populus* (Salicaceae), *Ulmus* (Ulmaceae), *Aegopodium* (Umbelliferae).

Phenology: V-VI.

General distribution: Europe [EUR].

Note: An infrequent species in Latvia. *Phyllobius vespertinus* and *Ph. pyri* are very similar and variable species, therefore difficult to determinate. Taxonomical status of *Ph. vespertinus* is not clear; some authors considered that specimens belongs to this taxon are aberrant specimens of *Ph. pyri* (N.N. Yunakov pers. comm.).

ACKNOWLEDGEMENTS

Authors are grateful to everybody assisted with the loan of material. Our special thanks to Jānis Dreimanis and Nikolajs Savenkovs (both - LDM, Rīga, LV) and Aina Karpa (LUBI, Salaspils, LV) for their kind permission to work with the collections and various support during our research.

The author greatly thank N.N. Yunakov (St. Petersburg, Russia) for valuable comments and constructive advice.

The research has been done within the framework of the project of European Social Fund (No 2009/0206/1DP/1.1.1.2.0/09/APIA/VIAA/010).
